

Get seen by a doctor — in your language.

When a migrant worker in Korea gets sick, they can't read the bill, can't afford a \$60–80/hr interpreter, and don't know which clinic will even treat them — so they skip care. K'Helper explains the cost in their language and books the visit, sending their details to the clinic already translated into Korean.

2.84Mforeign residents
(5.5% of Korea)**400–600K**uninsured
foreigners**<10%**hospitals with Khmer/
Bengali interpreters**\$40–80**per hour for a
human interpreter

THE PRODUCT — A HEALTH BOOKING LOOP

- **Understand.** Claude-powered chat explains the hospital bill and NHIS coverage in the user's language.
- **Find.** Clinics that serve foreigners — from free government open data (HIRA / data.go.kr).
- **Book.** Tap to book; the visit is scheduled with a partner clinic.
- **Translated pre-intake.** The clinic receives the patient's symptoms and status already in Korean — no front-desk confusion. This is the wedge.

WHY IT WINS & HOW IT PAYS

- **Clinics pay for patients.** They gain foreign customers they can't reach, delivered friction-free — a per-booking fee. The transaction is the business.
- **The user no one else serves.** Uninsured, low-income migrants are unprofitable to interpreter apps and invisible to super-apps.
- **Community trust as moat.** Founder-embedded, starting Cambodian — trust a funded competitor can't buy quickly.
- **Live today, near-zero cost.** PWA already shipped; the AI cost structure human-interpreter apps can't match.

THE COMPETITIVE READ · WHY NOW

The market is crowding — a KOSDAQ-listed super-app (**Hanpass**) is pivoting to AI, and free **government AI** now answers general questions. So we don't compete on "free information" — we route that to government and win on the one **action** none of them offer: booking care for the migrant they're not built to serve. Our only edge over Hanpass is that we're live and their AI isn't — so **speed and community trust** are everything.

WHERE WE ARE

Live at **khelper.org** — installable app, sign-in, multilingual chat, visa tracker, hospital finder. Next: the booking loop and first partner clinics in Ansan. Strategy is depth, not breadth — **own the health-booking habit in one community, then replicate community by community** faster than the big players can earn trust.

Open to conversations.

If this resonates, I'd love your perspective — advice, intros, or partnership.
